

Innovative disinfection with **STERAMIST**

POWERED BY BINARY IONIZATION TECHNOLOGY®

For the best possible protection of your production processes, we decontaminate your rooms using a state-of-the-art, patented technology with ionised hydrogen peroxide. EN 17272 certified, the process delivers the highest and most consistent disinfection effect for a sterile production environment.

The patented iHP™ - process

A cold plasma is used to convert **H₂O₂-molecules** into **iHP™**

iHP™ is applied microfine and spreads like a **gas**

Pathogenic structures are immediately attacked by **oxidation**

The **cellular disruptions** lead to **disinfection** of the treated areas

Decisive factor:

iHP™ particle size of only **0,03 µm – 3 µm**

→ behaves distributively like a gas
Many disinfection products: 40 - 120 µm
= **ten thousand times larger than iHP™-particles**

Your benefits

Quick

Hydroxyl radicals work **instantly** and only require **very short application times** (15-30 minutes)

Efficient

The **smallest particle sizes and electrical charge** ensure *excellent distribution and outstanding contact ergonomics*

Gentle

non-corrosive, due to very low **H₂O₂-percentage** and minimal **contact time**, good for sensitive materials & electronic devices

Environmentally friendly

No residues, no wiping, no contaminated waste, aggressive substances can be replaced

Huge time & cost savings

> 50% in comparison to VHP
